1. (Currently Amended) A method of manufacturing nanowires, comprising the steps of

[[-]] providing a patterned etching mask at a surface of a semiconductor substrate, and

[[-]] etching the semiconductor substrate so as to form nanowires in a direction

substantially perpendicular to the surface of the semiconductor substrate,

characterized in that

[[-]] the semiconductor substrate comprises a first layer of a first material and a second

layer of a second material, which layers adjoin one another; and

[[-]] etching takes place through the first and the second layer for forming the

nanowires such that the nanowires comprise a first region of the first material and a

second region of the second material.

2. (Original) A method as claimed in claim 1, characterized in that the first and the

second material comprise the same semiconductor but different dopings.

3. (Original) A method as claimed in claim 1, characterized in that the second layer is

formed by epitaxial growth of the second material on the first layer.

4. (Original) A method as claimed in claim 3, characterized in that the first material

comprises Si, and the second material is chosen from the group comprising SiC, SiGe,

and SiGeC.

5. (Currently Amended) A method as claimed in claim 1, characterized in that

[[-]] a third layer of a third material is present in the semiconductor substrate,

[[-]] the second layer lies sandwiched between the first layer and the third layer and

has a thickness of at most 100 nm, and

[[-]] etching takes place through the first, the second, and the third layer for forming

the nanowires, such that the nanowires comprise the first region, the second region, and a

third region composed of the third material.

Appl. No. Unassigned; Docket No. NL02 0287 US

Amdt. dated August 16, 2004

Preliminary Amendment

6. (Original) A method as claimed in claim 5, characterized in that the third material is

identical to the first material.

7. (Currently Amended) A method as claimed in claim 1, any of the claims 1-6, wherein

the nanowires are removed from the substrate after the etching of the substrate.

8. (Currently Amended) A nanowire provided with a first region of a first material and a

second region of a second material, which first and second materials are different, while

said first and second region are mutually adjoining, wherein said nanowire is obtainable

by the method as <u>claimed in claim 1</u>. <del>claimed in any one of the claims 1 to 7.</del>

9. (Original) An electronic device provided with a first and a second electrode which

are interconnected by one or several nanowires, characterized in that the nanowire of

claim 8 is present between the first and the second electrode.
